

# POSTDOC RESEARCH DAY

It's Mar. 30, 2017. Just finished a project PPT, but still want to record an unique memory, because it may only happen once in my whole life!

Today, I attended the postdoc research day, although I'm not a postdoc. And I had courses whole day. So, I was moving between the classes and the event several times. During the event, those postdocs were presenting one-by-one, I was not interested in everyone, so I was also doing my own projects during their talk. What a special experience, isn't it?

But I really learned many things. There were chemistry, geo-science, mathematics, psychology, linguistics and many others. The school does this just want to show our postdocs are working in every area, although I think this is true for every university...

# POSTDOC RESEARCH DAY

I'm especially interested in those outdoor research, it is very cool to see their photos. And I just learned that, scientists are very cautious to use "global warming", they are still trying to study why those glacier ice melt.

At the end, it was a keynote speaking. A postdoc talked about his avalanche research. The photos are really very cool, their hiking on the snowy mountain, skiing in heavy snow, testing airbag when there is avalanche.... all looked like real adventure. But that person talked really tooooooo slow, and his voice sounded very low....I had to keep eating during the talk so that I won't fall asleep...

I thought people study snow must be very loud, otherwise how could they get others' attention when there is avalanche?
